

Abad Naseer

Platform Engineer (GCP & Observability) | Google Cloud · Kubernetes · Terraform · CI/CD · Cloud Operations
+92 340-5059429 | abad.naseerfast@gmail.com | linkedin.com/in/abadnaseer | github.com/AbadNaseer | abad.falcoflow.com

EDUCATION

National University of Computer and Emerging Sciences (FAST-NUCES) Islamabad, Pakistan
Bachelor of Science in Software Engineering 2020 – 2025

EXPERIENCE

Platform Engineer (GCP & Observability) Jun. 2026 – Present
Ccscript Agency Islamabad, Pakistan

- Investigate and resolve production data pipeline issues across Google Cloud Platform, identifying root causes from data ingestion through reporting and analytics dashboards
- Build and maintain observability solutions to monitor platform health, data pipelines, scheduled jobs, and cloud services using GCP-native monitoring and logging practices
- Analyze large datasets in BigQuery to validate data quality, reconcile discrepancies, and troubleshoot reporting issues impacting business users and stakeholders
- Debug ETL/ELT workflows by tracing data across source systems, Cloud Storage, BigQuery, dbt transformations, and analytics dashboards
- Monitor scheduled jobs and ingestion processes, proactively identifying failures and ensuring reliable data delivery across production environments
- Collaborate with engineering, data, and business stakeholders to investigate production incidents, communicate findings, and implement validated fixes
- Develop and maintain monitoring documentation, operational runbooks, and SLA-related resources to improve platform reliability and incident response
- Configure and validate integrations with cloud services, including secure read-only monitoring access, IAM permissions, and operational visibility for support teams
- Perform production impact analysis before deployments, validate fixes in non-production environments, and follow change management best practices
- Work closely with cross-functional teams to improve data accuracy, platform reliability, cloud visibility, and production support processes

DevOps Engineer Oct. 2025 – Apr. 2026
Mediatiz Foundation Islamabad, Pakistan

- Managed AWS infrastructure (VPC, EC2, ECS, RDS, ALB, CloudFront, CloudWatch, SES, Route 53) for Mediatiz LMS and Khudi App serving 1M+ users with 20–30K concurrent requests at peak load; sustained 99.9% uptime
- Reduced AWS cloud costs by 30% through CloudWatch-driven auto-scaling, ECS task-definition tuning, and workload-aware right-sizing across staging and production clusters
- Built GitHub Actions CI/CD pipelines for Android (APK/AAB), QA automated testing, Laravel LMS, Django, and Next.js admin dashboard with zero-downtime ECS rollouts, Slack deployment alerts, and Google Play Console automation; eliminated manual release-engineering overhead and significantly improved QA automation and release reliability
- Architected and deployed PyBot – a Django + Ollama (Gemma 2B) local LLM tutor running on self-hosted infrastructure – eliminating external LLM API costs and addressing data-residency requirements for student PII
- Built serverless Slack-to-Google Sheets automation on AWS Lambda, API Gateway, EventBridge, and S3 for daily cross-departmental reporting across 8 departments; replaced a manual workflow
- Ran in-house security testing on stglms.mediatiz.org (brute-force, SQL injection, CSRF) using Kali Linux, SQLMap, and SonarQube; validated WAF rules and produced remediation reports adopted by the development team
- Authored the internal LMS DevOps Automation Roadmap and built CloudWatch dashboards covering ECS cluster health, RDS performance, and cost tracking

DevOps Engineer Dec. 2023 – Oct. 2025
Poshmaal Technologies Islamabad, Pakistan

- Firefly.online – AWS to On-Premises Migration:** Led end-to-end migration of an IoT SaaS platform (Node.js, React, PostgreSQL) from AWS to self-managed bare-metal infrastructure using a Blue-Green deployment strategy; replaced EC2, ECS, RDS, ALB, S3, CloudFront, Lambda, and Redis with fully self-hosted equivalents

- Executed full data migration – PostgreSQL databases, Redis persistence, and object storage – with zero customer-facing downtime; reduced infrastructure spend by ~60% while improving operational control and deployment flexibility
- **Platform Rebuild & Production Infrastructure:** Designed and provisioned Development, Staging, and Production environments during the migration from Node.js to Java Spring Boot; built and secured Ubuntu infrastructure with Java, Maven, Docker, PostgreSQL, Redis, Apache Kafka, Node.js, and NGINX
- Built GitHub Actions + SonarQube CI/CD pipelines automating code-quality checks, Docker image builds, and environment-specific deployments; configured Nginx upstream load balancing for multiple backend instances
- Deployed full-stack observability with Grafana, Prometheus, Loki, and Node Exporter for real-time monitoring, centralized logging, and alerting; hardened all environments with SSL/TLS (Let's Encrypt), UFW, Fail2ban, and SSH key restrictions
- **ERP Platform – Kubernetes GitOps Infrastructure (TransIP):** Architected and deployed a production-ready K3s cluster on TransIP; provisioned servers, networking, and cluster resources for ERP workloads spanning C2B, B2C, and C2C business domains
- Deployed and maintained 10+ microservices on K3s with environment isolation, ingress routing, scaling policies, and service-to-service networking; implemented Argo CD GitOps for automated, version-controlled deployments and consistent release management across environments
- **GCP Kubernetes Deployment:** Worked on Google Cloud Platform infrastructure by deploying and configuring Kubernetes workloads, supporting cluster setup, application deployment, ingress configuration, service exposure, and environment validation for containerized applications

CERTIFICATIONS & ACHIEVEMENTS

- **AWS Certified Solutions Architect** – In Progress
- **Certified Kubernetes Administrator (CKA)** – In Progress
- **RocketDevs (Vetted Talent):** Selected after technical assessments and interviews

PROJECTS

- | | |
|---|------|
| LogSense <i>Python, FastAPI, MLflow, Airflow, DVC, HuggingFace, Slack, PagerDuty</i> | 2024 |
| <ul style="list-style-type: none"> • Built NLP models for anomaly detection, issue classification, and automated root-cause analysis on infrastructure logs; reduced MTTR by ~45% • Designed end-to-end MLOps pipeline: MLflow (experiment tracking + model registry), DVC (data/model versioning), Airflow (orchestration); containerized FastAPI inference microservice • Wired webhook-driven alert routing to Slack, Microsoft Teams, and PagerDuty with severity-based escalation; grouped correlated anomalies before notifying on-call to cut alert noise • Minimized reliance on external LLM APIs by serving custom NLP models in-house for privacy and cost control | |
| Kubernetes GitOps Platform <i>K8s, ArgoCD, Helm, GitHub Actions, Prometheus, Traefik</i> | 2025 |
| <ul style="list-style-type: none"> • Deployed a 10-service polyglot microservices app (Go, Java, Node.js, Python) on a self-hosted bare-metal Kubernetes cluster via Helm; managed all cluster state in Git with ArgoCD auto-sync and self-healing on drift • Built GitHub Actions CI/CD for all 10 services – each pipeline builds and tags Docker images with the commit SHA, pushes to Docker Hub, and commits per-service tag overrides back to the GitOps repo for ArgoCD to roll out independently • Fixed broken upstream Dockerfiles – replaced the deleted openjdk:8-jdk image with a maven:3.8-eclipse-temurin-8 multi-stage build on amazoncorretto:8, and upgraded the Go dispatch service to Go 1.22+ to resolve a pprof dependency break • Deployed kube-prometheus-stack via ArgoCD (multi-source Application, tuned for an 8GB VPS); wrote ServiceMonitors and instrumented cart/payment services with prom-client (counters, gauges) verified end-to-end in Grafana via PromQL | |
| NextLab Platform Deployment <i>AWS, ECS, RDS, ALB, CloudFront, Route53, GitHub Actions</i> | 2025 |
| <ul style="list-style-type: none"> • Designed and deployed end-to-end AWS infrastructure for NextLab, covering networking, compute, databases, security, CI/CD, monitoring, and production operations. | |

TECHNICAL SKILLS

Cloud & Infrastructure: GCP (Compute Engine, GKE, BigQuery, Cloud Storage, Cloud SQL, IAM, Cloud Logging, Cloud Monitoring, Pub/Sub, Cloud Functions), AWS (EC2, ECS/ECR, RDS, ALB, S3, CloudFront, WAF, Lambda, API Gateway, EventBridge, CloudWatch, SES, Route 53, IAM, VPC), VPS, Linux (Ubuntu/Debian)

DevOps, CI/CD & IaC: Docker (multi-stage builds), Kubernetes (K3s, EKS), Helm, ArgoCD, GitOps workflows, Jenkins, GitHub Actions, Terraform, Ansible, Nginx, Traefik, Git, Blue-Green & Zero-Downtime Deployments, Self-Hosted Runners, Bash/Shell Scripting

Observability & Monitoring: Prometheus (ServiceMonitor, PromQL, prom-client), Grafana, Loki, EFK Stack (Elasticsearch, Fluentbit, Kibana), Jaeger, OpenTelemetry, eBPF (groundcover), CloudWatch Dashboards

DevSecOps & Security: AWS WAF, SSL/TLS (Let's Encrypt), OS & SSH Hardening, UFW/iptables, Vault (secrets), OWASP Testing (SQLi, CSRF, Brute-force), Kali Linux, SQLMap, SonarQube

AI & MLOps: MLflow, Airflow, DVC, FastAPI, HuggingFace, PyTorch, Ollama (local LLM), RAG (FAISS + MiniLM), LangChain

Databases, Messaging & Languages: PostgreSQL, MySQL, MariaDB Galera + ProxySQL, Redis, Apache Kafka, SQLite, Supabase | Python, Bash, Java/Spring Boot, PHP/Laravel, TypeScript, Kotlin, Next.js, React, Django, Node.js
